Project Name	AI-Powered Customer Support & Service Automation
Maximum Marks	2 Marks

Proposed Solution

S.N o	Parameter	Description
1	Problem Statement (Problem to be solved)	Traditional customer support and warranty management systems are often slow, manual, and inefficient. Customers face delays in ticket resolution, lack real-time updates, and experience difficulty tracking warranty claims. Support agents spend significant time handling repetitive tasks, while managers lack real-time visibility into service performance and SLA compliance.
2	Idea / Solution Description	Develop an AI-Powered Customer Support & Warranty Management System using Salesforce Service Cloud and Agentforce AI . The solution enables customers to register products, submit warranty claims, create support tickets, track case status, and receive instant assistance through an AI-powered chatbot. Support agents can efficiently manage cases with automated routing, while managers monitor service performance using dashboards and reports.
3	Novelty / Uniqueness	The system integrates Salesforce Service Cloud , Agentforce AI , Einstein AI , workflow automation, and real-time analytics into a single platform. AI-driven case classification, intelligent ticket routing, automated warranty validation, and personalized customer assistance reduce manual effort and significantly improve response times compared to conventional customer support systems.
4	Social Impact / Customer Satisfaction	The solution improves customer experience by providing faster responses, transparent ticket tracking, and simplified warranty claims. Organizations benefit from improved service quality, reduced operational costs, higher customer satisfaction, and better compliance with Service Level Agreements (SLAs).

|---|---------------------------------------|---|
| 5 | Business Model (Revenue Model) | The system follows a Software-as-a-Service (SaaS) model where businesses subscribe monthly or annually based on the number of users or support cases. Additional revenue can be generated through premium AI features, advanced analytics, custom integrations, enterprise support, and implementation services. |
| 6 | Scalability of the Solution | Built on the Salesforce Cloud Platform , the solution is highly scalable and supports thousands of users, support cases, and warranty records. It can be extended with additional Salesforce Clouds, third-party APIs, mobile applications, and AI capabilities without major architectural changes, making it suitable for startups, SMEs, and large enterprises. |
