

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	1 July 2026
Team ID	
Project Name	AI-Powered Customer Support & Service Automation
Maximum Marks	4 Marks

Problem Statement

An international Electronics & Gadgets company receives thousands of customer support requests daily through multiple communication channels. These requests commonly involve:

- Product malfunction and troubleshooting
- Warranty claim processing
- Order tracking requests
- Product replacement requests
- General customer inquiries
- Technical support

Currently, customer support operations rely heavily on manual processes. Support agents manually review incoming requests, assign cases, respond to customers, update records, and monitor service progress. This manual approach introduces several operational challenges.

Major issues include:

- Long customer waiting times
- Manual case assignment
- Repetitive support tasks
- Inconsistent customer responses
- Limited visibility into support performance
- Difficulty tracking Service Level Agreements (SLAs)
- Increased workload for support agents
- Delayed escalation of unresolved cases

As customer inquiries continue to increase, these problems directly affect customer satisfaction, operational efficiency, and business performance.

Therefore, an intelligent, automated, and scalable customer support solution is required to streamline service operations and improve the overall customer experience.

Proposed Solution

The proposed solution is an AI-powered customer support automation system developed using Salesforce Service Cloud and Agentforce.

The system integrates customer records, products, orders, warranty claims, support cases, automation flows, AI-powered assistance, reports, and dashboards into a single cloud-based platform.

The workflow begins when a customer submits a support request. Salesforce automatically creates a Case record and routes it to the appropriate support queue based on predefined assignment rules. Record-triggered Flows perform various automated actions such as:

- Sending acknowledgement emails
- Assigning support agents
- Updating case status
- Escalating overdue cases
- Sending warranty notifications
- Updating related records automatically

Agentforce assists both customers and support agents by generating intelligent responses, suggesting troubleshooting steps, answering frequently asked questions, and retrieving relevant knowledge articles.

Managers gain complete visibility into support operations through real-time reports and dashboards that display key performance indicators such as:

- Number of open cases
- Closed cases
- Average resolution time
- Pending warranty claims
- Queue workloads
- SLA compliance
- Customer satisfaction trends

Project Objectives at a Glance

Objective	Description
Improve Customer Experience	Reduce response time and improve service quality.
Automate Support Operations	Replace repetitive manual tasks with Salesforce Flows.

AI-Powered Assistance	Use Agentforce to provide intelligent responses and recommendations.
Centralized Data Management	Maintain customer, product, order, and warranty information in a single platform.
Efficient Case Management	Automatically create, assign, and resolve customer support cases.
Performance Monitoring	Generate reports and dashboards for service analysis.
Scalability	Support future business growth without major system changes.

Scope of the Project

The scope of the AI-Powered Customer Support & Service Automation system includes the complete lifecycle of customer service operations within an electronics and gadgets company.

The system provides functionality for:

- Customer Management
- Product Management
- Order Management
- Case Management
- Warranty Claim Management
- Queue-Based Case Assignment
- Approval Processes
- Email Notifications
- Salesforce Flow Automation
- Agentforce AI Integration
- Prompt Builder Integration
- Reports and Dashboards
- Lightning App Development
- Service Console Customization

The project focuses on automating customer support operations using Salesforce's declarative development tools without extensive custom coding. The system is designed to be scalable and can be extended in the future with additional communication channels such as live chat, WhatsApp integration, voice assistants, and predictive analytics.
